

of Science and Useful Arts

The Director

of the United States Patent and Trademark Office has received an application for a patent for a new and useful invention. The title and description of the invention are enclosed. The requirements of law have been complied with, and it has been determined that a patent on the invention shall be granted under the law.

Therefore, this United States

grants to the person(s) having title to this patent the right to exclude others from making, using, offering for sale, or selling the invention throughout the United States of America or importing the invention into the United States of America, and if the invention is a process, of the right to exclude others from using, offering for sale or selling throughout the United States of America, products made by that process, for the term set forth in 35 U.s.c. 154(a)(2) or (c)(1), subject to the payment of maintenance fees as provided by 35 U.s.c. 41(b). See the Maintenance Fee Notice on the inside of the cover.

Katherine Kelly Vidal

DIRECTOR OF THE UNITED STATES PATENT AND TRADEMARK OFFICE

Maintenance Fee Notice

If the application for this patent was filed on or after December 12, 1980, maintenance fees are due three years and six months, seven years and six months, and eleven years and six months after the date of this grant, or within a grace period of six months thereafter upon payment of a surcharge as provided by law. The amount, number and timing of the maintenance fees required may be changed by law or regulation. Unless payment of the applicable maintenance fee is received in the United States Patent and Trademark Office on or before the date the fee is due or within a grace period of six months thereafter, the patent will expire as of the end of such grace period.

Patent Term Notice

If the application for this patent was filed on or after June 8, 1995, the term of this patent begins on the date on which this patent issues and ends twenty years from the filing date of the application or, if the application contains a specific reference to an earlier filed application or applications under 35 U.S.C. 120, 121, 365(c), or 386(c), twenty years from the filing date of the earliest such application ("the twenty-year term"), subject to the payment of maintenance fees as provided by 35 U.S.C. 41(b), and any extension as provided by 35 U.S.C. 154(b) or 156 or any disclaimer under 35 U.S.C. 253.

If this application was filed prior to June 8, 1995, the term of this patent begins on the date on which this patent issues and ends on the later of seventeen years from the date of the grant of this patent or the twenty-year term set forth above for patents resulting from applications filed on or after June 8, 1995, subject to the payment of maintenance fees as provided by 35 U.S.C. 41(b) and any extension as provided by 35 U.S.C. 156 or any disclaimer under 35 U.S.C. 253.

(57)ABSTRACT

A method and system for receiving digital artifacts from a management server. The method includes sending a request for a digital artifact from a mobile application to the management server for display within a specific mobile application generated screen, receiving the digital artifact from the management server, and displaying the digital artifact with the specific mobile application generated screen.

DETERMINATION OF A PAYMENT METHOD USED IN AN NFC TRANSACTION

CROSS-REFERENCE TO RELATED APPLICATIONS

This application is a continuation of application Ser. No. 14/253,648, filed Apr. 15, 2014 titled "REMOTE TRANS-ACTION PROCESSING OF AT A TRANSACTION SERVER" which is a continuation and claims priority to ¹⁰ application Ser. No. 13/736,056, filed Jan. 7, 2013, titled "REMOTE TRANSACTION PROCESSING USING A DEFAULT PAYMENT METHOD" now U.S. Pat. No. 8,694,380 issued on Apr. 8, 2014 which is a continuation and claims priority to application Ser. No. 11/948,903, filed Nov. ¹⁵ 30, 2007, titled "METHOD AND SYSTEM FOR CON-DUCTING AN ONLINE PAYMENT TRANSACTION USING A MOBILE COMMUNICATION DEVICE", now U.S. Pat. No. 8,352,323 issued on Jan. 8, 2013 all of which are incorporated by reference herein in their entirety. ²⁰

FIELD OF INVENTION

The present invention relates to data communications and wireless devices.

BACKGROUND OF THE INVENTION

Mobile communication devices—e.g., cellular phones, personal digital assistants, and the like are increasingly ³⁰ being used to conduct payment transactions as described in U.S. patent application Ser. No. 11/933,351, entitled "Method and System For Scheduling A Banking Transaction Through A Mobile Communication Device", and U.S. patent application Ser. No. 11/467,441, entitled "Method and ³⁵ Apparatus For Completing A Transaction Using A Wireless Mobile Communication Channel and Another Communication Channel, both of which are incorporated herein by reference. Such payment transactions can include, for example, purchasing goods and/or services, bill payments, ⁴⁰ and transferring funds between bank accounts.

BRIEF SUMMARY OF THE INVENTION

In general, this specification describes a method and 45 system for conducting an online payment transaction through a point of sale device. The method includes receiving input from a user selecting an item for purchase through the point of sale device; calculating a total purchase amount for the item in response to a request from the user to 50 purchase the item; and sending payment authorization for the total purchase amount from the point of sale device to a payment entity, in which the payment authorization is sent to the payment entity via a mobile communication device of the user. The method further includes receiving a result of 55 the payment authorization from the payment entity through the mobile communication device; and completing the payment transaction based on the result of the payment authorization.

Particular implementations can include one or more of the 60 following features. The point of sale device can be a desktop computer, a laptop computer, or a terminal. The mobile communication device can be a cellular phone, a wireless personal digital assistant (PDA), or a laptop computer. The cellular phone can be an NFC-enabled phone. Sending 65 payment authorization for the total purchase amount from the point of sale device to a payment entity can include

2

sending the payment authorization securely to the payment entity. The payment entity can be a person, a computer system, or a bank. The method can further include maintaining a shopping list on the mobile communication device of the user, in which the shopping list includes a listing of one or more items to be purchased by the user. The payment authorization can be an authorization for payment with a credit card, a debit card, or a prepaid card.

The details of one or more implementations are set forth in the accompanying drawings and the description below. Other features and advantages will be apparent from the description and drawings, and from the claims.

BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 illustrates a block diagram of a communication system including a wireless mobile communication device and a management server in accordance with one implementation.

FIG. 2 illustrates one implementation of the wireless mobile communication device of FIG. 1.

FIG. **3** is a method for conducting a payment transaction using a point of sale device in accordance with one implementation.

FIG. **4** illustrates a block diagram of a communication system including a wireless mobile communication device and an online store in accordance with one implementation.

FIG. **5** is a block diagram of a data processing system suitable for storing and/or executing program code in accordance with one implementation.

Like reference symbols in the various drawings indicate like elements.

DETAILED DESCRIPTION OF THE INVENTION

FIG. 1 illustrates one implementation of a communication system 100. The communication system 100 includes a hand-held, wireless mobile communication device 102 a point-of-sale device 104 and a management server 106. In one implementation, the mobile communication device 102 includes a mobile application (discussed in greater detail below) that permits a user of the mobile communication device 102 to conduct payment transactions. Payment transactions can include, for example, using contactless payment technology at a retail merchant point of sale (e.g., through point of sale device 104), using mobile/internet commerce (e.g., purchase tickets and products, etc.), storage of payment information and other digital artifacts (e.g., receipts, tickets, coupons, etc.), storage of banking information (payment account numbers, security codes, PIN's, etc.), and accessing banking service (account balance, payment history, bill pay, fund transfer, etc.), and so on. The mobile communication device 102 can be a cellular phone, a wireless personal digital assistant (PDA), a laptop computer, or other wireless communication device. The point of sale device 104 can be a desktop computer, laptop computer, terminal, or other device that is configured to receive user input selecting items for purchase or other transaction.

In one implementation, authorizations for payment transactions that are made through the point of sale device 104 are sent from the point of sale device 104 to an issuer authorization (e.g., management server 106) through the mobile communication device 102 (as shown in FIG. 1). In one implementation, an issuer authorization is a payment entity that either approves or disapproves a payment transaction. An issuer authorization can be, e.g., a person, com-

45

puter system, bank (or other third party). One potential benefit of having payment authorizations flow through the mobile communication device 102 is that sensitive user information (e.g. account numbers, pin numbers, and/or identity information) need only be sent from the mobile communication device 102 directly to an issuer authorization. Such operation reduces the potential for identity theft and/or fraudulent purchases made through a point of sale device. For example, (in one implementation) payment authorizations cannot be sent to an issuer authorization if the 10 mobile communication device 102 is turned off.

FIG. 2 illustrates one implementation of the mobile communication device 102. The mobile communication device 102 includes a mobile application 200 that (in one implementation) is provided to the mobile communication device 15 102 through a remote server (e.g., management server 106). In one implementation, the mobile application is a Mobile Wallet application available from Mobile Candy Dish, Inc., of Alameda, CA. In one implementation, the mobile application is a hosted service, as described in U.S. patent 20 application Ser. No. 11/939,821, entitled "Method and System For Securing Transactions Made Through a Mobile Communication Device", which is incorporated herein by reference. In one implementation, the mobile application **200** is configured to send requests to the management server 25 for artifacts based on user input, e.g., received though a keypad (not shown) of the mobile communication device 102. Requests to the management server 106 can also be automated, via proximity-based services, e.g., consumer tapping (or in close proximity) an LBS/contactless/RFID 30 enabled phone against a smart poster (RFID/Bluetooth/LBS enabled, etc.), kiosk, or other device.

In one implementation, the mobile application 200 running on the mobile communication device 102 is configured to receive artifacts (e.g., advertisements, receipts, tickets, 35 coupons, media, content, and so on) from the management server 106. In one implementation, the management server 106 sends artifacts to the mobile application based on user profile information and/or a transaction history (or payment trends) associated with a user of the mobile communication 40 purchase is processed as normal by the merchant's online device 102 as described in U.S. patent application Ser. No. 11/944,267, entitled "Method and System For Delivering information To a Mobile Communication Device Based On Consumer Transactions", which is incorporated herein by reference.

In one implementation, the mobile communication device **102** is an NFC-enabled phone. The mobile communication device 102 can be NFC-enabled, for example, through an embedded chip or a sticker that is affixed to the cellular phone, as described in U.S. application Ser. No. 11/933,321, 50 entitled "Method and System For Adapting a Wireless Mobile Communication Device For Wireless Transactions", which is incorporated herein by reference. In one implementation, the NFC chip (or sticker) on the cellular phone can be used in conjunction with a merchant's point of sale 55 device as described in greater detail below.

For example, with reference to FIG. 4, in one implementation, the NFC chip (or sticker) on the cellular phone can communicate with NFC chips that are installed on the front of PC's (TV's, Kiosks, or any other device) and serve as 60 scanners/readers. In this implementation a mobile candy dish applet (e.g., MCD POS plugin 414) is installed on the consumer's computer (e.g., PC 404) which interfaces with the NFC chip on the PC. When a consumer (or user) is shopping online and they are ready to pay for their products, 65 the consumer opens his mobile wallet and selects one of the payment methods (e.g., credit card, debit card, prepaid card,

4

etc.) from their mobile wallet. If a default card has been selected already, this step is not necessary. The consumer then waves their phone over the NFC reader present on the PC 404. The consumer's payment credentials are transferred from the phone to the merchant website (e.g., online store application 410) using a communication protocol between the chip in the phone and the chip in the PC, which can be radio frequency for example. If the consumer has coupons in their mobile wallet the consumer can either elect to manually apply the coupon, save the coupon for a future use (against a larger purchase for example), or have the coupon automatically applied during the transaction and the transaction amount is updated. After the consumer enters any necessary validation information (e.g., pin) to provide a multi-factor authentication and confirms the transaction, the online purchase is processed as normal by the merchant's online processor. The mobile wallet can retrieve transaction data, account balance from the management server 408.

In one implementation, the mobile communication device 102 is a non NFC-enabled phone. In this implementation, the consumer connects his phone to the PC 404 via some non radio frequency method (e.g., IR, Bluetooth, USB cable, etc.). When a consumer is shopping online and they are ready to pay for their products, the consumer opens his mobile wallet and selects one of the payment methods (e.g., credit card, debit card, prepaid card, etc.) from their mobile wallet. If a default card has been selected already, this step is not necessary. The consumer then pushes, e.g., a "Buy now" button and the consumer's payment credentials are transferred from the phone to the merchant website (e.g., online store application 410) using the protocol between the phone and the PC 404 which can be radio frequency, for example. If the consumer has coupons in their mobile wallet the consumer can either elect to manually apply the coupon, save the coupon for a future use, or have the coupon automatically applied during the transaction and the transaction amount is updated. After the consumer enters any necessary validation information (e.g., pin) to provide multifactor authentication and confirms the transaction, the online processor. The mobile wallet can retrieve transaction data and account balance from the management server 408.

In one implementation, the management server 408 and merchant portal (e.g., online store 408) are maintained by trusted parties and use an encrypted tunnel to transfer financial data. When the consumer is ready to pay for their online product, they enter their cell phone number on the merchant portal. The merchant portal (which has an MCD applet (e.g., MCD POS plugin 414) installed on its server) securely connects to the management server 408 (that in one implemetation is maintained by Mobile Candy Dish (MCD)). In one implementation, the management server 408 identifies the consumer through their cell phone number, and verifies the consumer's authenticity by sending a unique transaction code to the consumer mobile wallet on their cell phone. The consumer then enters this unique transaction code onto the merchant's web portal. The merchant portal sends this transaction number to the management server 408 for authentication. Upon authentication, the consumer's virtual wallet and payment methods (e.g., credit card, debit card, prepaid card, etc.) are securely retrieved from the management server 408 and are displayed to the consumer in a window on a website associated with the merchant portal. The consumer selects one of these payment methods to pay for their transaction. If a default card has been selected already, this step is not necessary. If the consumer has coupons in their mobile wallet the consumer can either elect to manually apply the coupon, save the coupon for a future use, or have the coupon automatically applied during the transaction and the transaction amount is updated. After the consumer enters any necessary validation information to provide a multi-factor authentication and confirms the transaction, the online purchase is processed as normal by the merchant's online processor. The mobile wallet can retrieve transaction data, account balance from the management server **408**.

Referring to FIG. 2, in one implementation, the mobile 10 application 200 maintains a shopping list 202 for a consumer. Accordingly, consumers have the ability to store their shopping list in their mobile wallet and add, delete, or change items on their shopping list either in offline or online mode. In one implementation, consumers are sent coupons 15 based on items on their shopping list, preferences, previous shopping history, proximity to the physical retail store, or a combination of these parameters, as discussed in application Ser. No. 11/944,267, which is incorporated by reference above. If the consumer has coupons in their mobile wallet 20 the consumer can either elect to manually apply the coupon, save the coupon for a future use, or have the coupon automatically applied during the transaction and the transaction amount is updated. When a consumer wants to order the items on their shopping list via an on online merchant (in 25 contrast to a physical retail store), the consumer can logon to the merchant portal and electronically transmit their shopping list to the merchant portal either by waving their phone over NFC enabled PC's or some other connection such as IR, bluetooth, USB, or the like.

FIG. 3 illustrates a method 300 for conducting a payment transaction using a point of sale device (e.g., point of sale device 104). User input is received selecting one or more items for purchase (e.g., at the point of sale device) (step **302**). In general, the transaction being made at the point of 35 sale device can be any type of transaction that involves the exchange or transfer of funds-e.g., the transaction can be a payment transaction, a fund transfer, or other type of transaction. In response to a request from the user to purchase the one or more items, a total purchase amount for 40 the one or more items is calculated (e.g., by the point of sale device) (step 304). If the user has coupons in their mobile wallet the user can either manually apply the coupon or have the coupon automatically applied during the transaction and the transaction amount is updated. The user request to 45 purchase an item can be received, e.g., by a user clicking on a "buy now" icon that is displayed on a graphical user interface of the point of sale device. Payment authorization for the total purchase amount is sent to a payment entity through a mobile communication device of the user (step 50 **306**). A result of the payment authorization is received at the point of sale device from the payment entity via the mobile communication device (step 308). The payment transaction is completed based on the result of the payment authorization (step **310**). If the payment transaction was authorized by 55 the payment entity, then the sale of the items through the point of sale device is completed. Otherwise, if the payment transaction was not authorized by the payment entity, then the point of sale device terminates the payment transaction.

FIG. 4 illustrates an example payment transaction being 60 made in a communication system 400 in accordance with one implementation. The communication system 400 includes a mobile communication device 402, a personal computer (PC) 404, an online store 406, and a core (or datastore) 408. As indicated by interaction (1), a user (or 65 customer), using a phone (e.g., mobile communication device 402 or personal computer 404), browses an online

6

store website (online store application **410**) and finds an item that the customer wishes to purchase. This could also be a purchase made through a midlet application (PUS midlet **412**) residing on the mobile communication device **402**. The user then goes to, e.g., a checkout of the online store **406** make a purchase. If the user has coupons in their mobile wallet the user can either manually apply the coupon or have the coupon automatically applied during the transaction and the transaction amount is updated. When it comes time to authorize the purchase, (in one implementation) the user is given an option to purchase with the mobile communication device **402**. In one implementation, the mobile communication device **402** is an NFC-equipped phone (or NFC phone).

In interaction (2), when the user chooses to purchase with the mobile communication device 402, the online store application 410 sends the transaction information for authorization to the PUS vendor plugin (e.g., MCD PUS plugin 414). In one implementation, the PUS vendor plugin is installed in the merchant's online store and enables the merchant to accepts MCD Blaze payments as an alternative form of payment, similar to accepting credit cards for payment. As shown by interaction (3), the PUS vendor plugin formats, encrypts, and cryptographically signs the purchase authorization request which is sent via a secure SSL link (e.g., HTTPS, Bluetooth, IR, USB, or other suitable protocol) established by the browser/web application 416 back to the mobile communication device 402. As with the first scenario, all communications is over secure channels. (It may be required that the mobile wallet application be opened prior to beginning a phone online purchase.) The PUS midlet 412 is a component of the mobile wallet application that executes PayPass or other payment authorization protocol between. itself and the SE payment applications on the mobile communication device 402 (interaction (4)). The results of the request are sent back to the PUS vendor plugin.

As shown by interaction (5), the POS midlet **412** then forwards the properly formatted authorization request to a payment entity (e.g., issuer authorization **418**) for authorization. The results of the request are then sent back to the PUS component of the mobile wallet. Through interaction (6), the PUS midlet **412** then forwards the results back to the MCD POS plugin **414** to complete the purchase. The MCD PUS plugin **414** then forwards the purchase transaction information to the management server **408** for later customer viewing (interaction (7)). As indicated by interaction (8), users (or customers) will then be able to query the management server **408** and immediately obtain purchase information, either by phone or PC.

One or more of method steps described above can be performed by one or more programmable processors executing a computer program to perform functions by operating on input data and generating output. Generally, the invention can take the form of an entirely hardware embodiment, an entirely software embodiment or an embodiment containing both hardware and software elements. In one implementation, the invention is implemented in software, which includes but is not limited to firmware, resident software, microcode, etc. Furthermore, the invention can take the form of a computer program product accessible from a computerusable or computer-readable medium providing program code for use by or in connection with a computer or any instruction execution system. For the purposes of this description, a computer-usable or computer readable medium can be any apparatus that can contain, store, communicate, propagate, or transport the program for use by or in connection with the instruction execution system, apparatus, or device. The medium can be an electronic, magnetic, optical, electromagnetic, infrared, or semiconductor system (or apparatus or device) or a propagation medium. Examples of a computer-readable medium include a semiconductor or 5 solid state memory, magnetic tape, a removable computer diskette, a random access memory (RAM), a read-only memory (ROM), a rigid magnetic disk and an optical disk. Current examples of optical disks include compact disk-read 10 only memory (CD-ROM), compact disk-read/write (CD-R/ W) and DVD.

FIG. 5 illustrates a data processing system 500 suitable for storing and/or executing program code. Data processing system 500 includes a processor 502 coupled to memory 15 elements 504A-B through a system bus 506. In other implementations, data processing system 500 may include more than one processor and each processor may be coupled directly or indirectly to one or more memory elements through a system bus. Memory elements 504A-B can 20 transaction has been processed using the payment method include local memory employed during actual execution of the program code, bulk storage, and cache memories that provide temporary storage of at least some program code in order to reduce the number of times the code must be retrieved from bulk storage during execution. As shown, 25 input/output or I/O devices 508A-B (including, but not limited to, keyboards, displays, pointing devices, etc.) are coupled to data processing system 500. I/O devices 508A-B may be coupled to data processing system 500 directly or indirectly through intervening I/O controllers (not shown). 30

In one implementation, a network adapter 510 is coupled to data processing system 500 to enable data processing system 500 to become coupled to other data processing systems or remote printers or storage devices through communication link 512. Communication link 512 can be a 35 tion comprises at least one of information related to the private or public network. Modems, cable modems, and Ethernet cards are just a few of the currently available types of network adapters.

Although the present invention has been particularly described with reference to implementations discussed 40 above, various changes, modifications and substitutes are can be made. Accordingly, it will be appreciated that in numerous instances some features of the invention can be employed without a corresponding use of other features. Further, variations can be made in the number and arrange- 45 ment of components illustrated in the figures discussed above.

What is claimed is:

1. A method for determining a payment method used in a 50 Near Field Communication (NFC) transaction using an NFC protocol, the method comprising:

- receiving, at a remote management server, an identification code associated with a user via a first communication channel from an NFC terminal,
- wherein the identification code associated with the user is transmitted from a secure element memory to the NFC terminal via an NFC transceiver configured to use the NFC protocol through a second communication channel, while a secure element application configured to 60 use the NFC protocol is being executed by an NFC processor configured to use the NFC protocol in response to a detection of a near field communication inductive signal from the NFC terminal,
- wherein the secure element memory maintains the iden- 65 tification code associated with the user and the secure element application,

8

wherein the secure element memory, the NFC transceiver, and the NFC processor are all included in a secure element permanently embedded in a mobile device,

- the mobile device comprising a mobile device memory which maintains a non-browser based application, a mobile device display, a mobile device processor, and a mobile device wireless transceiver that supports voice and data interactions using a third communication channel; wherein the non-browser based application is a mobile operating system platform based application with a graphical user interface that is preinstalled or downloaded and installed on the mobile device, wherein the graphical user interface includes a graphical icon: and
- identifying, at the remote management server, a payment method that corresponds to the identification code associated with the user, wherein the payment method is maintained at the remote management server.

2. The method of claim 1, further wherein after the NFC that corresponds to the identification code associated with the user, receiving, at the mobile device, a digital artifact for display in the graphical user interface of the non-browser based application.

3. The method of claim 2, further wherein the digital artifact comprises an advertisement, receipt, ticket, coupon, media, metadata, and/or content.

4. The method of claim 1, wherein the payment method is information related to a credit card number, information related to a debit card number, or information related to a prepaid card number.

5. The method of claim 1, wherein no sensitive information is stored on the mobile device.

6. The method of claim 5, wherein the sensitive informapayment method or information related to an expiration date associated with the payment method.

7. The method of claim 1, further wherein the nonbrowser based application is operative when the mobile device is not connected to a wireless network.

8. The method of claim 2, further wherein the nonbrowser based application sends a request to the remote management server for retransmission of the digital artifact if it has not received the digital artifact from the remote management server within a certain period of time.

9. The method of claim 2, further wherein, the nonbrowser based application displays the digital artifact while the mobile device maintains a connection to a wireless network; and

further comprises:

55

- losing the connection of the mobile device to the wireless network while the non-browser based application displays the digital artifact; and
- in an offline mode, after losing the connection, continuing to display the digital artifact within the non-browser based application.

10. The method of claim 2, further wherein, the digital artifact is based on the remote management server correlating the identification code associated with the user, information related to the payment method, information related to the user, information related to the NFC transaction, and information related to a transaction history of the user.

11. A remote management server for determining a payment method used in a Near Field Communication (NFC) transaction using an NFC protocol comprising:

a remote management server receiver that receives an identification code associated with a user via a first 5

communication channel from an NFC terminal configured to use the NFC protocol,

- wherein the identification code associated with the user is transmitted to the NFC terminal configured to use the NFC protocol through a second communication channel via an NFC transceiver configured to use the NFC protocol when a secure element application configured to use the NFC protocol is being executed by an NFC processor configured to use the NFC protocol in response to a detection of a near field communication 10 inductive signal from the NFC terminal,
- wherein the secure element memory maintains the identification code associated with the user and the secure element application, wherein the secure element memory the NFC processor, and the NFC transceiver 15 are included in a secure element permanently embedded in a mobile device,
- the mobile device comprising a mobile device memory that stores a non-browser based application, a mobile device display, a mobile device processor, a mobile 20 device wireless transceiver that supports voice and data interactions using a third communication channel, wherein the non-browser based application is a mobile operating system platform based application with a graphical user interface that is preinstalled or down- 25 loaded and installed on the mobile device, wherein the graphical user interface includes a graphical icon;
- a remote management server processer that identifies a payment method that corresponds to the identification code associated with the user, wherein the payment 30 method is maintained at the remote management server.

12. The remote management server of claim 11, further wherein after the NFC transaction has been processed using the payment method that corresponds to the identification code associated with the user, receiving, at the mobile 35 device, a digital artifact for display in the graphical user interface of the non-browser based application.

13. The remote management server of claim 12, further wherein the digital artifact comprises an advertisement, receipt, ticket, coupon, media, metadata, and/or content.

14. The remote management server of claim 11, wherein the payment method is information related to a credit card number, information related to a debit card number, or information related to a prepaid card number.

15. The remote management server of claim 11, wherein no sensitive information is stored on the mobile device.

16. The remote management server of claim 15, wherein the sensitive information comprises at least one of information related to the payment method or information related to an expiration date associated with the payment method.

17. The remote management server of claim 11, further wherein the non-browser based application is operative when the mobile device is not connected to a wireless network.

18. The remote management server of claim 12, further wherein the non-browser based application sends a request to the remote management server for retransmission of the digital artifact if it has not received the digital artifact from the remote management server within a certain period of time.

19. The remote management server of claim 12, further wherein, the non-browser based application displays the digital artifact while the mobile device maintains a connection to a wireless network; and

further comprises:

- losing the connection of the mobile device to the wireless network while the non-browser based application displays the digital artifact; and
- in an offline mode, after losing the connection, continuing to display the digital artifact within the non-browser based application.

20. The remote management server of claim 12, further wherein, the remote management server bases the digital artifact on correlating the identification code associated with the user, information related to the payment method, information related to the user, information related to the NFC transaction, and information related to a transaction history of the user.

* * *
